Nucleotide constructs expression. The constructs can be used to genetically engineer host cells to express NHP products in vivo, these genetically engineered cells function as bioreactors in the body delivering a continuous supply of a also find use in molecular mutagenesis/evolution of proteins that are partially encoded by the NHP sequences. The encoded NHP polypeptides are partially encoded by the NHP sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               useful for generating antibodies, as reagents in diagnostic assays, for identifying other cellular gene products related to NHP and as reagents in assays for screening for compounds that are useful in the treatment of mental, biological or medical disorders and diseases. The present

                                                                                                                                                                                                                                                                                                                                                                                     techniques for treating symptomatic or phenotypic manifestations of techniques for treating symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs are useful in gene therapy for modulating NHP encoding NHP products are useful in gene therapy for modulating NHP encoding NHP products in vivo, these genetically engineered cells express NHP products in vivo, these genetically engineered cells encrion as bioreactors in the body delivering a continuous supply of a function as bioreactors in the body delivering a continuous supply of a function as bioreactors in the protein to the body. The sequences NHP, a NHP peptide, or a NHP fusion protein to the body. The sequences also find use in molecular mutdgenesis/evolution of proteins that are partially encoded by the NHP sequences. The encoded NHP polypeptides are useful for generating antibodies, as reagents in diagnostic assays, for useful for screening for compounds that are useful in the treatment of in assays for screening for compounds that are useful in the treatment of in assays for screening for compounds that are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (LEXI;) LEXICON GENETICS INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel human secreted proteins (NHP) that share structural similarity with semaphorin proteins, protein/peptide hormones of the neurohypophysial family and oxytocin (neurophysin 1 precursor) of the neurohypophysial family and oxytocin (neurophysin 1 precursor) family. The NHP nucleotide sequences are useful in drug screening family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2001-611483/70

The NHP nucleotide sequences are useful in drug screening techniques for treating symptomatic or phenotypic manifestations of techniques for treating symptomatic or phenotypic manifestations of encoding NHP products are useful in gene therapy for modulating NHP perturbing the normal function of NHP in the body. Nucleotide constructs expression. The constructs can be used to genetically engineer host cells expression. The constructs can be used to genetically engineer host cells expression. The constructs in the body delivering a continuous supply of a function as bioreactors in the body delivering a continuous supply of a function das bioreactors in the body delivering to the body. The sequences also find use in molecular mutagenesis/evolution of proteins that are also find use in molecular mutagenesis/evolution of proteins that are partially encoded by the NHP sequences. The encoded NHP polypeptides are neefful for generation antibodies as reasonts in diamonstic assence for partially encoded by the NHP sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes a human semaphorin polypeptide, designated CC 2SMF-16. ZSMF-16 is a neurite growth and development modulator. It also CC 2SMF-16. It also crid and sensory neurite outgrowth and patterning, and CC polynucleotide probes can be used to detect 3p21 loss, trisomy, or cancer. ZSMF-16 is useful for detecting a genetic abnormality or cancer. ZSMF-16 can be used to detect 3p21 loss, trisomy, or concer. ZSMF-16 can be used to detect 3p21 loss, trisomy, and complete tumour, liver, small intestine, bone cancers, etc.. ZSMF-16 can complete contribution associated with mammary tumour tissue, and concerns tumour, liver, small intestine, bone cancers, etc.. ZSMF-16 can concern structures. ZSMF-16 are also useful for regenerating and directing concernite outgrowths following strokes, brain damage caused by head concernite outgrowths following strokes, brain damage caused by head concernity of iscases such as amyotrophic lateral sclerosis, concernity disease, Huntington's disease, Parkinson's disease and concernity of also acts as a mediator of immunosuppression, concernity of it can also be used as an antiinflammatory for inhibition confirmational and organ transplants.

```
The present is a degenerate sequence encoding a semaphorin, designated CC 2SMF-16. ZSMF-16 is a neurite growth and development modulator. It also CC enhances spinal cord and sensory neurite outgrowth and patterning, and CC is involved in the activation and regulation of T lymphocytes suppressor CC ZSMF-16 is useful for detecting a genetic abnormality or cancer. ZsMF-16 CC polynucleotide probes can be used to detect 3p21 loss, trisomy. CC polynucleotide probes can be used to detect 3p21 loss, trisomy. CC be used to modulate neurite growth and development and demarcate nervous consist tumour, liver, small intestine, bone cancers, etc. ZsMF-16 can neurite outgrowths following strokes, brain damage caused by head cc injuries, paralysis caused by spinal injuries, and for treating and directing cc neurodegenerative diseases such as amyotrophic lateral sclerosis. CC Alzheimer's disease, Huntington's disease, Parkinson's disease and cc and thus useful for diagnosing and treating diseases e.g., multiple caused by spinal injuries, and for treating cc and thus useful for diagnosing and treating duseases. G. multiple consults dependent diabetes, rheumatoid arthritis, and multiple consults and cellular immunity and for inhabition cc in oraft and organ transplants.
                                                                                                                                                                                            Matches 1270; Conservative

                                                                                                                                                                                                                                                                                                                                                                             This is the mouse Semaphorin-H polynucleotide sequence (Sema H). The CS semaphorin/Collapsin family of molecules are characterised by a unique and highly conserved motif, within a 500 amino acid semaphorin domain. CC and highly conserved motif, within a 500 amino acid semaphorin domain. CC context, and functions in bone structure formation are also implicated. CC context, and functions in bone structure formation are also implicated. CC context, and functions in bone structure formation are also implicated the mouse Sema H gene in the diagnosis of metastatic cancer. Semaphorin the mouse Sema H gene in the diagnosis of metastatic cancer semaphorin cc invention, the polypeptides are used in the methods of the mouse sema H gene in the section for determining the metastatic cc invention, the polypeptides are useful for determining the metastatic cc intention of cells, by detecting their expression in biological samples. CC inhibiting Sema-H polypeptides are also useful therapeutically in the polypeptides are also useful therapeutically in the polypeptides are also useful therapeutically in the polypeptides are also be inhibited by a semail cc inhibiting the polypeptides are invented and therefore metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAZ28469 standard; DNA; 4460 BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptides and polynucleotides, useful in diagnosis and treatment of metastatic cancer \ddot{\ }
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lukanidin EM,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 78-85; 95pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            p-PSDB; AAZ28469
                                                                                                                                                                                                                                                                           purifying the biological activity of the polypeptide using e.g. a small inhibiting the biological activity of the polypeptide using e.g. a small molecule inhibitor or a Semaphorin-H ligand (or fragment). The polynucleotides can also be used to inhibit polypeptide expression in polynucleotides can also be used to inhibit polypeptide expression for calls using known antisense technology e.g. to prevent metastasis of cancer cells. They can be used to detect and quantify Sema-H mRNA levels cancer cells. They can be used to detect and quantify sema-H mRNA levels
                                                                                                                                                                               in cells. The polypeptides, fusion proteins, multimeric proteins, antibodies or antisense oligonucleotides can be included in antibodies or antisense oligonucleotides can be used to isolate pharmaceutical compositions. The polynucleotides can be used to isolate similar sequences from other species and to produce mammalian cell lines and tumours with known metastatic potential, useful in anti-metastatic and tumours with known metastatic potential,
                                                                                                                   Sequence 4460 BP; 1288 A; 950 C; 1023 G; 1199 T; 0 other;

CC by a unique and highly conserved motif, within a 500 amino acid commaphorin domain. Some semaphorins exhibit inhibitory or repulsive conformations in a neuronal context, and functions in bone structure contexts. The invention uses the mouse sema H plays a role in the methods of the invention, the polypeptides are useful for determining the metastatic potential of cells, by detecting their calso useful thorapeutically in inhibiting sema-H polypeptides are used converses in this biological samples. Antibodies specific for Sema H, are converted by inhibiting the biological activity and colypeptide using e.g. a small molecule inhibitor or a Semaphorin-H coplypeptide expression in cells using known antisense technology e.g. to polypeptide expression in cells using known antisense technology e.g. to convert metastasis of cancer cells. The polypeptides, wetastasis may convert metastasis of cancer cells. The polypeptides con be used to inhibit convert metastasis of cancer cells. The polypeptides can be used to inhibit convert metastasis of cancer cells. The polypeptides can be used to inhibit convert metastasis in cells using known antisense technology e.g. to included in pharmaceutical compositions. The polypucleotides can be used to inhibit converted to inhibit converted to the converted co

     caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzhelmer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, diabetes mellitus method allows a definitive diagnosis of Alzheimer's disease in living may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically microtubule associated proteins Tau and Big Tau, ubiquitin B,
                                                                                                                                                                                                    This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift
